HOW I BUILT IT · POWER BI TRAINING PROJECT

# Enterprise Cybersecurity and Network Analysis

From five messy CSVs to one security dashboard

Kritika Chhabra

**5**
CSV files

**7**
model tables

**4**
report pages

WHY THIS TOPIC

# Cybersecurity data tests every skill a Power BI analyst needs

### Fast answers matter

A security team needs to see incidents, traffic and exposure at a glance.

### The data is realistic

Five tables with mixed case, blanks and negative values give real cleaning work.

### The whole workflow fits

Power Query, modelling, DAX, design, interactivity and publishing in one project.

**Because every second of delay in detecting a threat can cost an enterprise its data, money, and trust.**

HOW IT WAS BUILT

# Six steps took the project from raw files to a published report

1

**Load**

Import 5 CSV files into Power BI Desktop

2

**Clean**

Fix labels, blanks and bad values in Power Query

3

**Model**

7 relationships, shared Date table

4

**Measure**

14 reusable DAX measures in one table

5

Design

Four pages in a purple theme

6

**Publish**

Add interactivity, then publish to the Service

STEP 2 · CLEAN

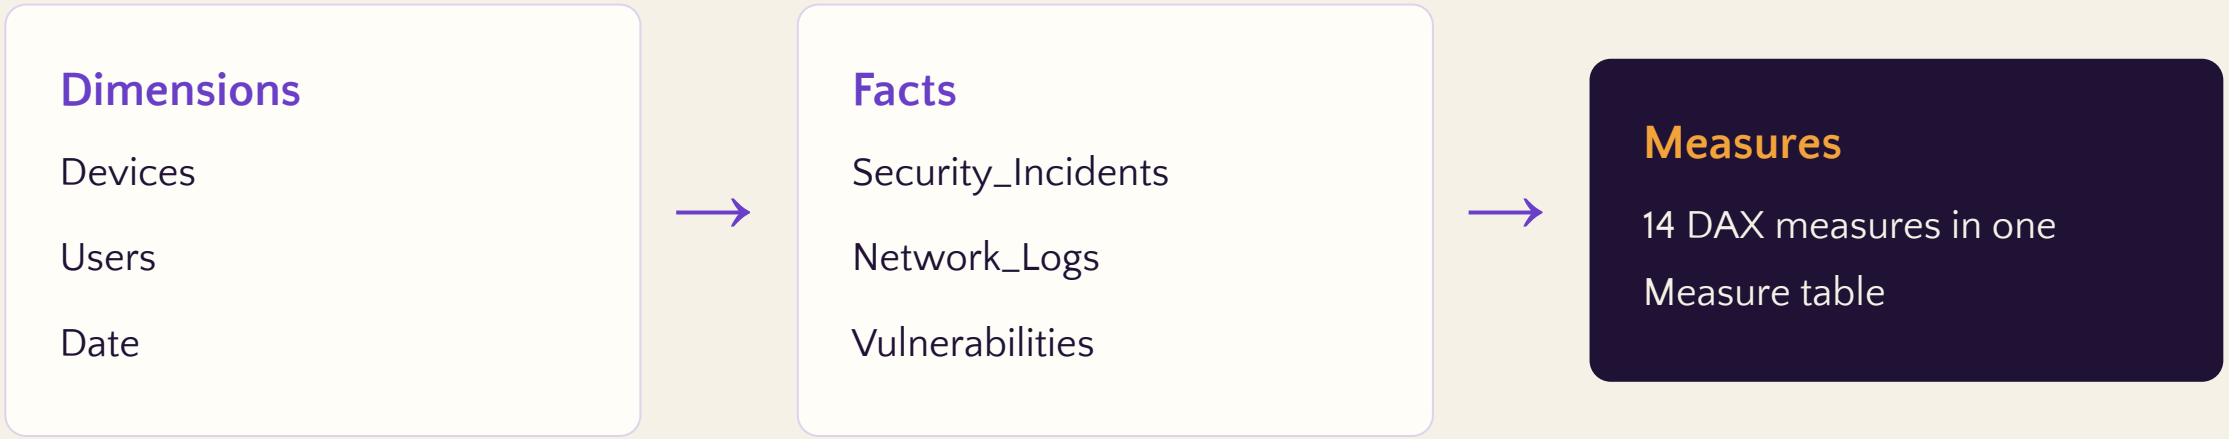

# Power Query turns five messy CSVs into trusted tables

| Column | Raw problem | Distinct values |
| --- | --- | --- |
| Severity | Mixed case such as HIGH and high | 7 to 4 |
| Department | Case and spacing variants | 11 to 8 |
| OperatingSystem | Labels like Win11 and ubuntu | 12 to 9 |
| Protocol | tcp counted apart from TCP | 9 to 8 |
| PatchStatus | pending and not patched variants | 6 to 4 |

Negative byte counts became null, empty labels became Unknown, and missing CVE IDs stayed null on purpose.

STEPS 3 AND 4 · MODEL AND MEASURES

# A Dimensional Data Model Keeps Every Number Consistent

7 one-to-many relationships, one shared Date table for 2025 and 2026, and hierarchies that power drill-down.

STEPS 5 AND 6 · DESIGN AND PUBLISH

# Four report pages share one theme, one header and one navigator

### Security Overview

Six KPI cards for incidents and vulnerabilities

### Network Analytics

Five KPI cards, trend line, donut and protocol columns

### Threat Analysis

Attack matrix, location, source and resolution charts

### Risk and Vulnerabilities

Risk level, patch status, department and device charts

**Slicers** **Drill-down**

WHAT THE FINISHED REPORT SHOWS

# Three questions, three answers from the dashboard

**167**

**What is happening?**

of 1,200 incidents are still open, and SQL Injection is the most frequent attack.

**10.8%**

**How is traffic behaving?**

of 2,500 network logs were blocked, and 5.4% were suspicious.

**47.8%**

**How exposed are we?**

of 500 vulnerabilities are patched, and 52 are Critical.

THANK YOU

# Thank you. Questions?

A dashboard is only as trustworthy as its cleaning
